TypeScript Objects

Objects of TypeScript

Motivation

With a growing understanding of typescript, we will now look deeper into objects.

We have already seen objects being used in TypeScript and its specialities.

Also have we seen several forms, simple:

```
function greet(person: { name: string; age: number }) {
  return "Hello " + person.age;
}
```

With an interface:

```
interface Person {
  name: string;
  age: number;
}

function greet(person: Person) {
  return "Hello " + person.age;
}
```

With a type alias:

```
1 type Person = {
2   name: string;
3   age: number;
4 };
5
6 function greet(person: Person) {
7   return "Hello " + person.age;
8 }
```

But sometimes we need to have optional properties.

Let us look at the following pseudocode example.

Shapes appear in different kinds, and therefore we need a way to have optional properties.

Shapes appear in different kinds, and therefore we need a way to have optional properties.

```
interface PaintOptions {
    shape: Shape;
    xPos?: number;
    yPos?: number;
}

function paintShape(opts: PaintOptions) {
    // ...
}

const shape = getShape();
paintShape({ shape });
paintShape({ shape , xPos: 100 });
paintShape({ shape, yPos: 100 });
paintShape({ shape, yPos: 100 });
paintShape({ shape, xPos: 100 });
paintShape({ shape, xPos: 100 });
```

Shapes appear in different kinds, and therefore we need a way to have optional properties.

```
interface PaintOptions {
    shape: Shape;
    xPos?: number;
    yPos?: number;
}

function paintShape(opts: PaintOptions) {
    // ...
}

const shape = getShape();
paintShape({ shape });
paintShape({ shape , xPos: 100 });
paintShape({ shape, yPos: 100 });
paintShape({ shape, xPos: 100 });
paintShape({ shape, xPos: 100 });
paintShape({ shape, xPos: 100 });
```

As you can see, shape is needed but **xPos** and **yPos** can be omitted.

In other circumstances you want to make sure that your property is read-only:

```
interface SomeType {
   readonly prop: string;
}

function doSomething(obj: SomeType) {
   // We can read from 'obj.prop'.
   console.log(`prop has the value '${obj.prop}'.`);
   // But we can't re-assign it.
   obj.prop = "hello";
   // Cannot assign to 'prop' because it is a read-only property.
}
```

Using the readonly modifier does not necessarily imply that a value is **totally immutable**. It just means the property itself can not be rewritten.

In other circumstances you want to make sure that your property is read-only:

```
interface SomeType {
   readonly prop: string;
}

function doSomething(obj: SomeType) {
   // We can read from 'obj.prop'.
   console.log(`prop has the value '${obj.prop}'.`);
   // But we can't re-assign it.
   obj.prop = "hello";
   // Cannot assign to 'prop' because it is a read-only property.
}
```

Using the readonly modifier does not necessarily imply that a value is **totally immutable**. It just means the property itself can not be rewritten.

In other circumstances you want to make sure that your property is read-only:

```
interface SomeType {
   readonly prop: string;
}

function doSomething(obj: SomeType) {
   // We can read from 'obj.prop'.
   console.log(`prop has the value '${obj.prop}'.`);
   // But we can't re-assign it.
   obj.prop = "hello";
   // Cannot assign to 'prop' because it is a read-only property.
}
```

Using the readonly modifier does not necessarily imply that a value is **totally immutable**. It just means the property itself can not be rewritten.

Another quite common example is that you have two or more slightly different interfaces. If this is the case, you probably face an interface that needs to be extended.

Have a look at the following interfaces:

```
1 interface BasicAddress {
2   name?: string;
3   street: string;
4   city: string;
5   postalCode: string;
6 }
7
8 interface AddressWithUnit {
9   name?: string;
10   unit: string;
11   street: string;
12   city: string;
13   postalCode: string;
14 }
```

The only difference is the added unit in AddressWithUnit.

If OOP is not new to you, you might immediately think you can extend interfaces.

If OOP is not new to you, you might immediately think you can extend interfaces.

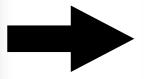

```
1 interface BasicAddress {
2   name?: string;
3   street: string;
4   city: string;
5   postalCode: string;
6  }
7
8 interface AddressWithUnit {
9   name?: string;
10   unit: string;
11   street: string;
12   city: string;
13   postalCode: string;
14 }
```

If OOP is not new to you, you might immediately think you can extend interfaces.

```
1 interface BasicAddress {
2   name?: string;
3   street: string;
4   city: string;
5   postalCode: string;
6 }
7
8 interface AddressWithUnit {
9   name?: string;
10   unit: string;
11   street: string;
12   city: string;
13   postalCode: string;
14 }
```

If OOP is not new to you, you might immediately think you can extend interfaces.

```
1 interface BasicAddress {
2   name?: string;
3   street: string;
4   city: string;
5   postalCode: string;
6 }
7
8 interface AddressWithUnit {
9   name?: string;
10   unit: string;
11   street: string;
12   city: string;
13   postalCode: string;
14 }
```

```
interface BasicAddress {
  name?: string;
  street: string;
  city: string;
  country: string;
  postalCode: string;
}

interface AddressWithUnit extends BasicAddress {
  unit: string;
}
```

Multiple interface extends are also possible:

```
interface Colorful {
  color: string;
}

interface Circle {
  radius: number;
}

interface ColorfulCircle extends Colorful, Circle {}

const cc: ColorfulCircle = {
  color: "red",
  radius: 42,
};
```

Objects intersection Types

Interfaces allow us to build up new types from other types by extending them.

TypeScript provides another construct mainly used to combine existing object types. Consider the following:

```
interface Colorful {
color: string;
}

interface Circle {
 radius: number;
}

type ColorfulCircle = Colorful & Circle;
```

Objects Exercise

Please think about a structure of at least three levels,

For example, Animal -> Pet -> Dog and try to implement extending useful interfaces.

Also, try to do this with intersection and extends in *04_objects/exercises/01_objects.ts*.

```
1 interface Animal {
       name: string
 3 }
 5 interface Pet extends Animal {
       tame: boolean
 7 }
 8
 9 interface Dog extends Animal {
10
       color: string,
11
       age: number
12 }
13
14
15 function printMyDog(dog: Dog) {
16
       console.log(`My dog is called: '${dog.name}'.`);
17 }
18
19
20 printMyDog({name: "flipper", age: 5, color: "beige"})
21
```

```
1 interface Animal {
       name: string
 3 }
 5 interface Pet extends Animal {
       tame: boolean
 7 }
 8
 9 interface Dog extends Animal {
10
       color: string,
11
       age: number
12 }
13
14
15 function printMyDog(dog: Dog) {
16
       console.log(`My dog is called: '${dog.name}'.`);
17 }
18
19
20 printMyDog({name: "flipper", age: 5, color: "beige"})
21
```

```
1 interface Animal {
       name: string
 3 }
 5 interface Pet extends Animal {
       tame: boolean
 7 }
 9 interface Dog extends Animal {
10
       color: string,
11
       age: number
12 }
13
14
15 function printMyDog(dog: Dog) {
16
       console.log(`My dog is called: '${dog.name}'.`);
17 }
18
19
20 printMyDog({name: "flipper", age: 5, color: "beige"})
21
```

```
1 interface Animal {
       name: string
 3 }
 5 interface Pet extends Animal {
       tame: boolean
 7 }
 8
 9 interface Dog extends Animal {
10
       color: string,
11
       age: number
12 }
13
14
15 function printMyDog(dog: Dog) {
16
       console.log(`My dog is called: '${dog.name}'.`);
17 }
18
19
20 printMyDog({name: "flipper", age: 5, color: "beige"})
21
```

```
1 interface Animal {
       name: string
 3 }
 5 interface Pet extends Animal {
       tame: boolean
 7 }
 8
 9 interface Dog extends Animal {
10
       color: string,
11
       age: number
12 }
13
14
15 function printMyDog(dog: Dog) {
16
       console.log(`My dog is called: '${dog.name}'.`);
17 }
18
19
20 printMyDog({name: "flipper", age: 5, color: "beige"})
21
```

```
1 interface Animal {
       name: string
 3 }
 5 interface Pet extends Animal {
       tame: boolean
 9 interface Dog extends Animal {
10
       color: string,
11
       age: number
12 }
13
14
15 function printMyDog(dog: Dog) {
16
       console.log(`My dog is called: '${dog.name}'.`);
17 }
18
19
20 printMyDog({name: "flipper", age: 5, color: "beige"})
21
```

Good Job!

Objects are getting clearer now, let us cover other topics.

Enc

That was all for this chapter
